

Caring for the Caregivers

Patient caregivers/helpers frequently have to choose between caring for the patient and preventing relationship, financial and/or health damage to themselves. Our SpecNav care navigation services provide that, much-needed, relief for those caregivers by leading the health management effort in a manner that enhances the quality of care received by the patient, while relieving the burden on the caregiver and creating peace-of-mind for everyone involved.

Challenges faced by the caregiver or care partner (helper):

1. Most care recipients (69%) did not have a home visit by a healthcare professional after discharge from the hospital.
2. Almost half (46%) of family caregivers perform medical or nursing tasks for their loved ones with multiple chronic physical and cognitive conditions.
3. Three out of four (78%) who provide these medical or nursing tasks manage medications, including administering intravenous fluids and injections.
4. Most family caregivers report that they received little or no training to perform these tasks.
5. Many caregivers develop immobility, mental health or life-threatening health conditions associated with their caregiving duties.

With our services, the need for the care partner (helper) to become a caregiver could be delayed or, possibly, prevented.
